Foundations of Educational Theory for Online Learning*  
Mohamed Ally

*Foundations of Educational Theory for Online Learning di Mohamed Ally costituisce la parte introduttiva di Theory and practice of online learning, una guida curata da Terry Anderson e Fathi Elloumi e pubblicata online dalla Athabasca University (http://cde.athabascau.ca/online_book/). Il testo rappresenta un significativo passo avanti nella riflessione sul mondo della formazione Open e sulle difficoltà e potenzialità che le nuove tecnologie per la comunicazione e l'informazione offrono alla formazione superiore. L’esperienza più che trentennale dell’Athabasca University e gli studi condotti dai suoi ricercatori, messi a disposizione di enti e istituzioni dell’e-Learning attraverso il Creative Commons Copyright, assicurano una cifra di qualità e una risorsa preziosa per la ricerca.

Secondo i risultati della ricerca The virtual University and e-Learning, commissionata nel 2004 dall’UNESCO, l’Athabasca University è la più importante istituzione universitaria canadese completamente dedicata allo studio a distanza, con una popolazione studentesca di circa 30.000 iscritti. L’Università opera dal 1970 con l’obiettivo di offrire un’alternativa alla formazione residenziale accessibile anche a quei potenziali studenti che, per ragioni economiche, di tempo o spazio, non potrebbero accedere a corsi universitari in presenza.

Mohamed Ally, direttore del Centre for Computing and Information Systems della Athabasca University e docente della stessa università, ha utilizzato la sua lunga ed eccezionale esperienza didattica e di approfondimento come fonte primaria delle riflessioni qui proposte e continuamente aggiornate online.

Introduction

There is ongoing debate about whether it is the use of a particular delivery technology or the design of the instruction that improves learning (Clark, 2001; Kozma, 2001). It has long been recognized that specialized delivery technologies can provide efficient and timely access to learning materials; however, Clark (1983) has claimed that technologies are merely vehicles that deliver instruction, but do not themselves influence student achievement. As Clark notes, meta-analysis studies on media research have shown that students gain significant learning benefits when learning from audio-visual or computer media, as opposed to conventional instruction; however, the same studies suggest that the reason for those benefits is not the medium of instruction, but the instructional strategies built into the learning materials. Similarly, Schramm (1977) suggested that learning is influenced more by the content and instructional strategy in the learning materials than by the type of technology used to deliver instruction. According to Bonk and Reynolds (1997), to promote higher-order thinking on the Web, online learning must create challenging activities that enable learners to link new information to old, acquire meaningful knowledge, and use their metacognitive abilities; hence, it is the instructional strategy and not the technology that influences the quality of learning. Kozma (2001) argues that the particular attributes of the computer are needed to bring real-life models and simulations to the learner; thus, the medium does influence learning. However, it is not the computer per se that makes students learn, but the design of the real-life models and simulations, and the students’ interaction with those models and simulations. The computer is merely the vehicle that provides the processing capability and delivers the instruction to learners (Clark, 2001). Kozma is correct in his claim, but learners will not learn from the simulations if the simulations are not developed using sound design principles.

Online learning allows for flexibility of access, from anywhere and usually at anytime - essentially, it allows participants to collapse time and space (Cole, 2000) - however, the learning materials must be designed properly to engage the learner and promote learning. According to Rossett (2002), online learning has many promises, but it takes commitment and resources, and it must be done right. “Doing it right” means that online learning materials must be designed properly, with the learners and learning in focus, and that adequate support must be provided. Ring and Mathieux (2002) suggest that online learning should have high authenticity (i.e., students should learn in the context of the workplace), high interactivity, and high collaboration. This paper discusses the foundation of educational theory for the design of effective online learning materials, and suggests a model for developing online instruction based on appropriate educational theory.
Different terminologies have been used for online learning, a fact that makes it difficult to develop a generic definition. Terms that are commonly used include e-Learning, Internet learning, distributed learning, networked learning, tele-learning, virtual learning, computer-assisted learning, Web-based learning, and distance learning. All of these terms imply that the learner is at a distance from the tutor or instructor, that the learner uses some form of technology (usually a computer) to access the learning materials, that the learner uses technology to interact with the tutor or instructor and other learners, and that some form of support is provided to learners. This paper will use the term “online learning” throughout. There are many definitions of online learning in the literature, definitions that reflect the diversity of practice and associated technologies. Carliner (1999) defines online learning as educational material that is presented on a computer. Khan (1997) defines online instruction as an innovative approach for delivering instruction to a remote audience, using the Web as the medium.

However, online learning involves more than just the presentation and delivery of the materials using the Web: the learner and the learning process should be the focus of online learning. As a result, the author defines online learning as the use of the Internet to access learning materials; to interact with the content, instructor, and other learners; and to obtain support during the learning process, in order to acquire knowledge, to construct personal meaning, and to grow from the learning experience.

**Benefits of Online Learning**

Increasingly, organizations are adopting online learning as the main delivery method to train employees (Simmons, 2002). At the same time, educational institutions are moving toward the use of the Internet for delivery, both on campus and at a distance. However, for organizations and institutions to make this often expensive move, there must be a perception that using online learning provides major benefits. Some of the benefits for learners and instructors are outlined below. For learners, online learning knows no time zones, and location and distance are not an issue. In asynchronous online learning, students can access the online materials at anytime, while synchronous online learning allows for real time interaction between students and the instructor. Learners can use the Internet to access up-to-date and relevant learning materials, and can communicate with experts in the field in which they are studying. Situated learning is facilitated, since learners can complete online courses while working on the job or in their own space, and can contextualize the learning.

For the instructor, tutoring can be done at anytime and from anywhere.
Online materials can be updated, and learners are able to see the changes at once. When learners are able to access materials on the Internet, it is easier for instructors to direct them to appropriate information based on their needs. If designed properly, online learning systems can be used to determine learners’ needs and current level of expertise, and to assign appropriate materials for learners to select from to achieve the desired learning outcomes.

**Designing Online Learning Materials**

The goal of any instructional system is to promote learning. Therefore, before any learning materials are developed, educators must, tacitly or explicitly, know the principles of learning and how students learn. This is especially true for online learning, where the instructor and the learner are separated. The development of effective online learning materials should be based on proven and sound learning theories. As we discussed above, the delivery medium is not the determining factor in the quality of learning; rather, the design of the course determines the effectiveness of the learning (Rovai, 2002).

There are many schools of thought on learning, and no one school is used exclusively to design online learning materials. As there is no single learning theory to follow, one can use a combination of theories to develop online learning materials. In addition, as research progresses, new theories are evolving that should be used in developing online materials. The online developer must know the different approaches to learning in order to select the most appropriate instructional strategies. Learning strategies should be selected to motivate learners, facilitate deep processing, build the whole person, cater for individual differences, promote meaningful learning, encourage interaction, provide feedback, facilitate contextual learning, and provide support during the learning process. The remaining sections of this paper will present the different schools of thought on learning, and will suggest how they can be used to develop effective online materials.

**Schools of Learning**

Early computer learning systems were designed based on a behaviourist approach to learning. The behaviourist school of thought, influenced by Thorndike (1913), Pavlov (1927), and Skinner (1974), postulates that learning is a change in observable behaviour caused by external stimuli in the environment (Skinner, 1974).

Behaviourists claim that it is the observable behaviour that indicates whether or not the learner has learned something, and not what is going on in the learner’s head. In response, some educators claimed that not
all learning is observable and that there is more to learning than a change in behaviour. As a result, there was a shift away from behaviourist to cognitive learning theories. Cognitive psychology claims that learning involves the use of memory, motivation, and thinking, and that reflection plays an important part in learning. They see learning as an internal process, and contend that the amount learned depends on the processing capacity of the learner, the amount of effort expended during the learning process, the depth of the processing (Craik, Lockhart, 1972; Craik, Tulving, 1975), and the learner’s existing knowledge structure (Ausubel, 1974).

Recently, there has been a move to constructivism. Constructivist theorists claim that learners interpret information and the world according to their personal reality, and that they learn by observation, processing, and interpretation, and then personalize the information into personal knowledge (Cooper, 1993; Wilson, 1997). Learners learn best when they can contextualize what they learn for immediate application and to acquire personal meaning.

When the behaviourist, cognitivist, and constructivist schools of thought are analyzed closely, many overlaps in the ideas and principles become apparent. The design of online learning materials can include principles from all three. According to Ertmer and Newby (1993), the three schools of thought can in fact be used as a taxonomy for learning. Behaviourists’ strategies can be used to teach the “what” (facts), cognitive strategies can be used to teach the “how” (processes and principles), and constructivist strategies can be used to teach the “why” (higher level thinking that promotes personal meaning and situated and contextual learning).

Janicki and Liegle (2001) analyzed different instructional design models to identify the components that support quality design of Web-based instruction. Components were identified from each of the behaviourist, cognitivist, and constructivist schools of learning.

**Behaviourist School of Learning**

The behaviourist school sees the mind as a “black box,” in the sense that a response to a stimulus can be observed quantitatively, totally ignoring the effect of thought processes occurring in the mind. The school, therefore, looks at overt behaviours that can be observed and measured as indicators of learning (Good, Brophy, 1990).
Implications for Online Learning

1. Learners should be told the explicit outcomes of the learning so that they can set expectations and can judge for themselves whether or not they have achieved the outcome of the online lesson.

2. Learners must be tested to determine whether or not they have achieved the learning outcome. Online testing or other forms of testing and assessment should be integrated into the learning sequence to check the learner’s achievement level and to provide appropriate feedback.

3. Learning materials must be sequenced appropriately to promote learning. The sequencing could take the form of simple to complex, known to unknown, and knowledge to application.

4. Learners must be provided with feedback so that they can monitor how they are doing and take corrective action if required.

Cognitivist School of Learning Part 1: Memory

Cognitivists see learning as an internal process that involves memory, thinking, reflection, abstraction, motivation, and metacognition. Cognitive psychology looks at learning from an information processing point of view, where the learner uses different types of memory during learning (Figure 1-1). Sensations are received through the senses into the sensory store before processing occurs. The information persists in the sensory store for less than one second (Kalat, 2002); if it is not transferred to working memory immediately, it is lost.

Online instruction must use strategies to allow learners to attend to the learning materials so that they can be transferred from the senses to the sensory store and then to working memory. The amount of information transferred to working memory depends on the amount of attention that was paid to the incoming information, and on whether cognitive structures are in place to make sense of the information. So, designers must check to see if the appropriate existing cognitive structure is present to enable the learner to process the information. If the relevant cognitive structure is not present, pre-instructional strategies, such as advance organizers, should be included as part of the learning process (Ausubel, 1960).
The duration in working memory is approximately 20 seconds, and if information in working memory is not processed efficiently, it is not transferred to long-term memory for storage (Kalat, 2002). Online learning strategies must present the materials and use strategies to enable students to process the materials efficiently. Since working memory has limited capacity, information should be organized or chunked in pieces of appropriate size to facilitate processing. According to Miller (1956), because humans have limited short-term memory capacity, information should be grouped into meaningful sequences. He suggests that information should be chunked into five to nine (i.e., 7 ± 2) meaningful units to compensate for the limited capacity of short-term memory.

After the information is processed in working memory, it is stored in long-term memory. The amount transferred to long-term memory is determined by the quality and depth of processing in working memory. The deeper the processing, the more associations the acquired new information forms in memory. Information transferred from short-term memory to long-term memory is either assimilated or accommodated in long-term memory. During assimilation, the information is changed to fit into existing cognitive structures. Accommodation occurs when an existing cognitive structure is changed to incorporate the new information. Cognitive psychology postulates that information is stored in long-term memory in the form of nodes which connect to form relationships; that
is, in networks. Information maps that show the major concepts in a topic and the relationships between those concepts should be included in the online learning materials. According to Stoyanova and Kommers (2002), information map generation requires critical reflection and is a method for externalizing the cognitive structure of learners. To facilitate deeper processing, learners should be encouraged to generate their own information maps.

**Implications for Online Learning**

1. Strategies should be used to allow learners to perceive and attend to the information so that it can be transferred to working memory. Learners use their sensory systems to register the information in the form of sensations. Strategies to facilitate maximum sensation should be used. Examples include the proper location of the information on the screen, the attributes of the screen (color, graphics, size of text, etc.), the pacing of the information, and the mode of delivery (audio, visuals, animations, video). Learners must receive the information in the form of sensations before perception and processing can occur; however, they must not be overloaded with sensations, which could be counterproductive to the learning process. Non-essential sensations should be avoided to allow learners to attend to the important information. Strategies to promote perception and attention for online learning include those listed below.

- Important information should be placed in the center of the screen for reading, and learners must be able to read from left to right.
- Information critical for learning should be highlighted to focus learners’ attention. For example, in an online lesson, headings should be used to organize the details, and formatted to allow learners to attend to and process the information they contain.
- Learners should be told why they should take the lesson, so that they can attend to the information throughout the lesson.
- The difficulty level of the material must match the cognitive level of the learner, so that the learner can both attend to and relate to the material. Links to both simpler and more complicated materials can be used to accommodate learners at different knowledge levels.

2. Strategies should be used to allow learners to retrieve existing information from long-term memory to help make sense of the new information. Learners must construct a memory link between the new information and some related information already stored in long-term memory. Strategies to facilitate the use of existing schema are listed below.
Use advance organizers to activate an existing cognitive structure or to provide the information to incorporate the details of the lesson (Ausubel, 1960). A comparative advance organizer can be used to recall prior knowledge to help in processing, and an expository advance organizer can be used to help incorporate the details of the lesson (Ally, 1980). Mayer (1979) conducted a meta-analysis of advance organizer studies, and found that these strategies are effective when students are learning from text that is presented in an unfamiliar form. Since most courses contain materials that are new to learners, advance organizers should be used to provide the framework for learning.

Provide conceptual models that learners can use to retrieve existing mental models or to store the structure they will need to use to learn the details of the lesson.

Use pre-instructional questions to set expectations and to activate the learners’ existing knowledge structure. Questions presented before the lesson facilitate the recall of existing knowledge, and so help learners learn the materials and motivate them to find additional resources to achieve the lesson outcome.

Use prerequisite test questions to activate the prerequisite knowledge structure required for learning the new materials.

With the flexibility of online learning, students with diverse backgrounds and knowledge can choose the most appropriate path to review previous or prerequisite learning before new information is presented.

3. Information should be chunked to prevent overload during processing in working memory (Miller, 1956). Online learning materials should present between five and nine items on a screen to facilitate efficient processing in working memory. If there are many items in a lesson, the items should be organized in the form of information maps to show their organization. A generalized information map is provided as an overview for the online lesson, and can be linear, hierarchical, or spider-shaped, as illustrated in Figures 1-2 to 1-4 (Holley et al., 1979; Smith, Ragan, 1999). As the lesson progresses, each item in the generalized information map is presented and broken down into sub-items. At the end of the lesson, the generalized map is shown again, but with the relationships among the items illustrated.

To facilitate deep processing, learners should be asked to generate the information maps during the learning process or as a summary activity after the lesson (Bonk, Reynolds, 1997). In addition to facilitating deep processing, information maps can provide the “big picture” to learners, to help them comprehend the details of a lesson. Online learning can capitalize on the processing and visual capabilities of the computer to present information maps to learners or to ask learners to generate information maps using mapmaking software.
4. Other strategies that promote deep processing should be used to help transfer information to long-term storage. Strategies that require learners to apply, analyze, synthesize, and evaluate promote higher-level learning, which makes the transfer to longterm memory more effective. Online strategies to allow learners to apply the information in real life should also be included, to contextualize the learning and to facilitate deep processing.
Cognitive School of Learning Part 2: Individual Differences

The cognitive school recognizes the importance of individual differences, and of including a variety of learning strategies in online instruction to accommodate those differences. Learning style refers to how a learner perceives, interacts with, and responds to the learning environment; it is a measure of individual differences. Different learning style instruments are used to determine students’ learning styles. The Kolb Learning Style Inventory (LSI) (Kolb, 1984) looks at how learners perceive and process information, whereas the Myers-Briggs Type Indicator (Myers, 1978) uses dichotomous scales to measure extroversion versus introversion, sensing versus intuition, thinking versus feeling, and judging versus perception. In the following discussion, we consider the Kolb Learning Style Inventory.

Kolb (1984) suggests that two components make up our learning experience: perceiving and processing. Perceiving refers to the way learners sense and absorb the information around them, from concrete experience to reflective observation. Concrete experience relates to students’ desire to learn things that have personal meaning in life. During reflective observation, students like to take the time to think about and reflect on the learning materials. The second component, processing, is related to how learners understand and process the information that is absorbed after perceiving. Processing ranges from abstract conceptualization to active experimentation. Learners who have a preference for abstract conceptualization like to learn facts and figures, and to research new information on different topics. Learners who have a preference for active experimentation prefer to apply what they learn.
to real-life situations and to go beyond what was presented. They like to try things and learn from their experience. Online learning can cater for individual differences by determining the learner’s preference and providing appropriate learning activities based on the learner’s style.

Cognitive style refers to a learner’s preferred way of processing information; that is, the person’s typical mode of thinking, remembering, or problem solving. Thus, cognitive style is another individual difference indicator. Cognitive style is considered to be a personality dimension that influences attitudes, values, and social interaction. One of the dimensions of cognitive style that has implications for online learning is the distinction between field-dependent and field-independent personalities (Witkin et al., 1977). Field-independent personalities approach the environment in an analytical manner; for example, they are able to distinguish figures as discrete from their backgrounds. Field-dependent individuals experience events in a more global, less differentiated way. Field-dependent individuals have a greater social orientation compared with field-independent personalities. Field-independent individuals are likely to learn more effectively under conditions of intrinsic motivation (e.g., self-study), and are influenced less by social reinforcement.

**Implications for Online Learning Continued**

5. Online learning materials should include activities for the different learning styles, so that learners can select appropriate activities based on their preferred style. **Concrete-experience learners** prefer specific examples in which they can be involved, and they relate to peers and not to people in authority. They like group work and peer feedback, and they see the instructor as coach or helper. These learners prefer support methods that allow them to interact with peers and obtain coaching from the instructor. **Reflective-observation learners** like to observe carefully before taking any action. They prefer that all the information be available for learning, and see the instructor as the expert. They tend to avoid interaction with others. **Abstract conceptualization learners** like to work more with things and symbols and less with people. They like to work with theory and to conduct systematic analyses. **Active-experimentation learners** prefer to learn by doing practical projects and through group discussions. They prefer active learning methods and interacting with peers for feedback and information. They tend to establish their own criteria for evaluating situations.

6. In addition to activities, adequate supports should be provided for students with different learning styles. Ally and Fahy (2002) found that students with different learning styles have different preferences for support. For example, assimilators prefer high instructor presence, while
accommodators prefer low instructor presence.

7. Information should be presented in different modes to accommodate individual differences in processing and to facilitate transfer to long-term memory. Where possible, textual, verbal, and visual information should be presented to encourage encoding. According to dual-coding theory (Paivio, 1986), information received in different modes (textual and visual) will be processed better than that presented in a single mode (textual only). Dual-coded information is processed in different parts of the brain, resulting in more encoding.

8. Learners should be motivated to learn. It does not matter how effective the online materials are, if learners are not motivated, they will not learn. The issue is whether to use intrinsic motivation (driven from within the learner) or extrinsic motivation (instructor and performance driven). Designers of online learning materials should use intrinsic motivation strategies (Malone, 1981); however, extrinsic motivation should also be used since some learners are motivated by externally driven methods. Keller proposed a model (ARCS - Attention, Relevance, Confidence, Satisfaction) for motivating learners during learning (Keller, 1983; Keller, Suzuki, 1988).

Attention: Capture the learners’ attention at the start of the lesson and maintain it throughout the lesson. The online learning materials must include an activity at the start of the learning session to connect with the learners. Relevance: Inform learners of the importance of the lesson and how taking the lesson could benefit them. Strategies could include describing how learners will benefit from taking the lesson, and how they can use what they learn in real-life situations. This strategy helps to contextualize the learning and make it more meaningful, thereby maintaining interest throughout the learning session.

Confidence: Use strategies such as designing for success and informing learners of the lesson expectations. Design for success by sequencing from simple to complex, or known to unknown, and use a competency-based approach where learners are given the opportunity to use different strategies to complete the lesson. Inform learners of the lesson outcome and provide ongoing encouragement to complete the lesson.

Satisfaction: Provide feedback on performance and allow learners to apply what they learn in real-life situations. Learners like to know how they are doing, and they like to contextualize what they are learning by applying the information in real life.

9. Encourage learners to use their metacognitive skills to help in the
learning process (Meyer, 1998; Sternberg, 1998). Metacognition is a learner’s ability to be aware of his or her cognitive capabilities and use these capabilities to learn. When learning online, learners should be given the opportunity to reflect on what they are learning, collaborate with other learners, and to check their progress. Self-check questions and exercises with feedback throughout a lesson are good strategies to allow learners to check how they are doing, so that they can use their metacognitive skills to adjust their learning approach if necessary.

10. Online strategies that facilitate the transfer of learning should be used to encourage application in different and real-life situations. Simulation of the real situation, using real-life cases, should be part of the lesson. Also, learners should be given the opportunity to complete assignments and projects that use real life applications and information. Transfer to real-life situations could assist the learners to develop personal meaning and contextualize the information.

Cognitive psychology suggests that learners receive and process information to be transferred into long-term memory for storage. The amount of information processed depends on the amount that is perceived, and the amount stored in long-term memory depends on the quality of the processing in working memory. Effective online lessons must use techniques to allow learners to sense and perceive the information, and must include strategies to facilitate high-level processing for transfer of information to long-term memory. After learners acquire the information, they create personal knowledge to make the materials meaningful. The constructivist school of learning, which is discussed below, suggests that learners construct personal knowledge from the learning experience.

**Constructivist School of Learning**

Constructivists see learners as being active rather than passive. Knowledge is not received from the outside or from someone else; rather, it is the individual learner’s interpretation and processing of what is received through the senses that creates knowledge. The learner is the centre of the learning, with the instructor playing an advising and facilitating role. Learners should be allowed to construct knowledge rather than being given knowledge through instruction (Duffy, Cunningham, 1996). A major emphasis of constructivists is situated learning, which sees learning as contextual. Learning activities that allow learners to contextualize the information should be used in online instruction. If the information has to be applied in many contexts, then learning strategies that promote multi-contextual learning should be used to make sure that learners can indeed apply the information broadly. Learning is moving away from one-way
instruction to construction and discovery of knowledge (Tapscott, 1998). In his transformation theory, Mezirow (1991) uses both constructivism and cognitivism to explain how people learn. He sees learning as “the process of using a prior interpretation to construe a new or revised interpretation of the meaning of one’s experience in order to guide future action”. Transformative learning involves “reflectively transforming the beliefs, attitudes, opinions, and emotional reactions that constitute our meaning schemes or transforming our meaning perspectives”. Mezirow claimed that learning involves five interacting contexts: the frame of reference or meaning perspective in which the learning is embedded, the conditions of communication, the line of action (process) in which the learning occurs, the self-image of the learner, and the situation encountered during the learning process.

**Implications for Online Learning**

1. Learning should be an active process. Keeping learners active doing meaningful activities results in high-level processing, which facilitates the creation of personalized meaning. Asking learners to apply the information in a practical situation is an active process, and facilitates personal interpretation and relevance.

2. Learners should construct their own knowledge rather than accepting that given by the instructor. Knowledge construction is facilitated by good interactive online instruction, since the students have to take the initiative to learn and to interact with other students and the instructor, and because the learning agenda is controlled by the student (Murphy, Cifuentes, 2001). In the online environment, students experience the information at first-hand, rather than receiving filtered information from an instructor whose style or background may differ from theirs. In a traditional lecture, the instructor contextualizes and personalizes the information to meet their own needs, which may not be appropriate for all learners. In online instruction, learners experience the information first-hand, which gives them the opportunity to contextualize and personalize the information themselves.

3. Collaborative and cooperative learning should be encouraged to facilitate constructivist learning (Hooper, Hannafin, 1991; Johnson, Johnson, 1996; Palloff, Pratt, 1999). Working with other learners gives learners real-life experience of working in a group, and allows them to use their metacognitive skills. Learners will also be able to use the strengths of other learners, and to learn from others. When assigning learners for group work, membership should be based on the expertise level and learning style of individual group members, so that individual team members can benefit from one another’s strengths.
4. Learners should be given control of the learning process. There should be a form of guided discovery where learners are allowed to make decision on learning goals, but with some guidance from the instructor.

5. Learners should be given time and opportunity to reflect. When learning online, students need the time to reflect and internalize the information. Embedded questions on the content can be used throughout the lesson to encourage learners to reflect on and process the information in a relevant and meaningful manner; or learners can be asked to generate a learning journal during the learning process to encourage reflection and processing.

6. Learning should be made meaningful for learners. The learning materials should include examples that relate to students, so that they can make sense of the information. Assignments and projects should allow learners to choose meaningful activities to help them apply and personalize the information.

7. Learning should be interactive to promote higher-level learning and social presence, and to help develop personal meaning. According to Heinich et al. (2002), learning is the development of new knowledge, skills, and attitudes as the learner interacts with information and the environment. Interaction is also critical to creating a sense of presence and a sense of community for online learners, and to promoting transformational learning (Murphy, Cifuentes, 2001). Learners receive the learning materials through the technology, process the information, and then personalize and contextualize the information. In the transformation process, learners interact with the content, with other learners, and with the instructors to test and confirm ideas and to apply what they learn. Garrison (1999) claimed that it is the design of the educational experience that includes the transactional nature of the relationship between instructor, learners, and content that is of significance to the learning experience.

Different kinds of interaction will promote learning at different levels. Figure 1-5 shows interactive strategies to promote higher level learning (Berge, 1999; Gilbert, Moore, 1998; Schwier, Misanchuk, 1993). Hirumi (2002) proposed a framework of interaction in online learning that consists of three levels. Level one is learner-self interaction, which occurs within the learner to help the learner monitor and regulate their own learning. Level two interaction is learner-human and learner-non-human interactions, where the learner interacts with human and non-human resources. Level three is learner-instruction interaction, which consists of activities to achieve a learning outcome. This paper will go one step further and propose interactions that go from lower-level to higherlevel interactions based on behaviourist, cognitivist, and constructivist schools of learning.
At the lowest level of interaction, there must be learner-interface interaction to allow the learner to access and sense the information. The interface is where learners use the senses to register the information in sensory storage. In online learning, the interface is with the computer to access the content and to interact with others.

Once learners access the online materials, there must be learner-content interaction to process the information. Learners navigate through the content to access the components of the lesson, which could take the form of pre-learning, learning, and post-learning activities. These activities could access reusable learning objects from a repository (McGreal, 2002; Wiley, 2002), or they could use content that has been custom created by the designer or instructor.

Students should be given the ability to choose their own sequence of learning, or should be given one or more suggested sequences. As online learners interact with the content, they should be encouraged to apply, assess, analyze, synthesize, evaluate, and reflect on what they learn (Berge, 2002). It is during the learner-content interaction that learners process the information to transform it from short-term to long-term memory. The higher the level of processing, the more associations are
made in long-term memory, which results in higher-level learning. As learners work through the content, they will find the need for learner support, which could take the form of learner-to learner, learner-to-instructor, instructor-to-learner, and learner-to-expert interactions (Moore, 1989; Rourke et al., 2001; Thiessen, 2001). There should be strategies to promote learner-context interaction to allow learners to apply what they learn in real life so that they can contextualize the information. Learner-context interaction allows learners to develop personal knowledge and construct personal meaning from the information.

**Conclusion**

This paper concludes by proposing a model, based on educational theory, that shows important learning components that should be used when designing online materials. Neither placing information on the Web nor linking to other digital resources on the Web constitutes online instruction. Online instruction occurs when learners use the Web to go through the sequence of instruction, to complete the learning activities, and to achieve learning outcomes and objectives (Ally, 2002; Ritchie, Hoffman, 1997). A variety of learning activities should be used to accommodate the different learning styles. Learners will choose the appropriate strategy to meet their learning needs. Refer to Figure 1-6 for key components that should be considered when designing online learning materials.

**Learner Preparation**

A variety of pre-learning activities can be used to prepare learners for the details of the lesson, and to get them connected and motivated to learn the online lesson. A rationale should be provided to inform learners of the importance of taking the online lesson and to show how it will benefit them. A concept map is provided to establish the existing cognitive structure, to incorporate the details of the online lesson, and to activate learners’ existing structures to help them learn the details in the lesson. The lesson concept map also gives learners the “big picture”. Learners should be informed of the learning outcomes of the lesson, so that they know what is expected of them and will be able to gauge when they have achieved the lesson outcomes. An advance organizer should be provided to establish a structure to organize the details in the online lesson or to bridge what learners already know and what they need to know. Learners must be told the prerequisite requirements so that they can check whether they are ready for the lesson. Providing the prerequisites to learners also activates the required cognitive structure to help them
learn the materials. A self-assessment should be provided at the start of the lesson to allow learners to check whether they already have the knowledge and skills taught in the online lesson. If learners think they have the knowledge and skills, they should be allowed to take the lesson final test. The self-assessment also helps learners to organize the lesson materials and to recognize the important materials in the lesson. Once learners are prepared for the details of the lesson, they can go on to complete the online learning activities to learn the details of the lesson.

**Learner Activities**

Online learners should be provided with a variety of learning activities to achieve the lesson learning outcome and to accommodate learners' individual needs. Examples of learning activities include reading textual materials, listening to audio materials, or viewing visuals or video materials. Learners can conduct research on the Internet and link to online information and libraries to acquire further information. The preparation of a learning journal will allow learners to reflect on what they learn and provide personal meaning to the information. Appropriate application exercises should be embedded throughout the online lesson to establish the relevance of the materials. Practice activities, with feedback, should be included to allow learners to monitor how they are performing, so that they can adjust their learning method if necessary. A summary should be provided, or learners should be required to generate a lesson summary, to promote higher-level processing and to bring closure to the lesson.

**Learner Interaction**

As learners complete the learning activities, they will be involved with a variety of interactions. Learners need to interact with the interface to access the online materials. The interface should not overload learners, and should make it as easy as possible for learners to sense the information for transfer to sensory store and then into short-term memory for processing. Learners must interact with the content to acquire the information needed to form the knowledge base. There should be interaction between the learner and other learners, between the learner and the instructor, and between the learner and experts to collaborate, participate in shared cognition, form social networks, and establish social presence. Learners should be able to interact within their context to personalize information and construct their own meaning.
**Learner Transfer**

Opportunities should be provided for learners to transfer what they learn to real-life applications, so that they can be creative and go beyond what was presented in the online lesson.

**Looking Ahead**

Behaviourist, cognitivist, and constructivist theories have contributed in different ways to the design of online materials, and they will continue to be used to develop learning materials for online learning. Behaviourist strategies can be used to teach the facts (what); cognitivist strategies to teach the principles and processes (how); and constructivist strategies to teach the real-life and personal applications and contextual learning. There is a shift toward constructive learning, in which learners are given the opportunity to construct their own meaning from the information presented during the online sessions. The use of learning objects to promote flexibility and reuse of online materials to meet the needs of individual learners will become more common in the future. Online learning materials will be designed in small coherent segments, so that they can be redesigned for different learners and different contexts. Finally, online learning will be increasingly diverse to respond to different learning cultures, styles, and motivations.
Figure 1-6 Components of effective online learning

- Learning outcomes
- Advanced organizer
- Content map
- Prerequisites
- Journalizing
- Apply
- Research
- Practise
- Read, listen and view
- Summarize
